# Introducción {

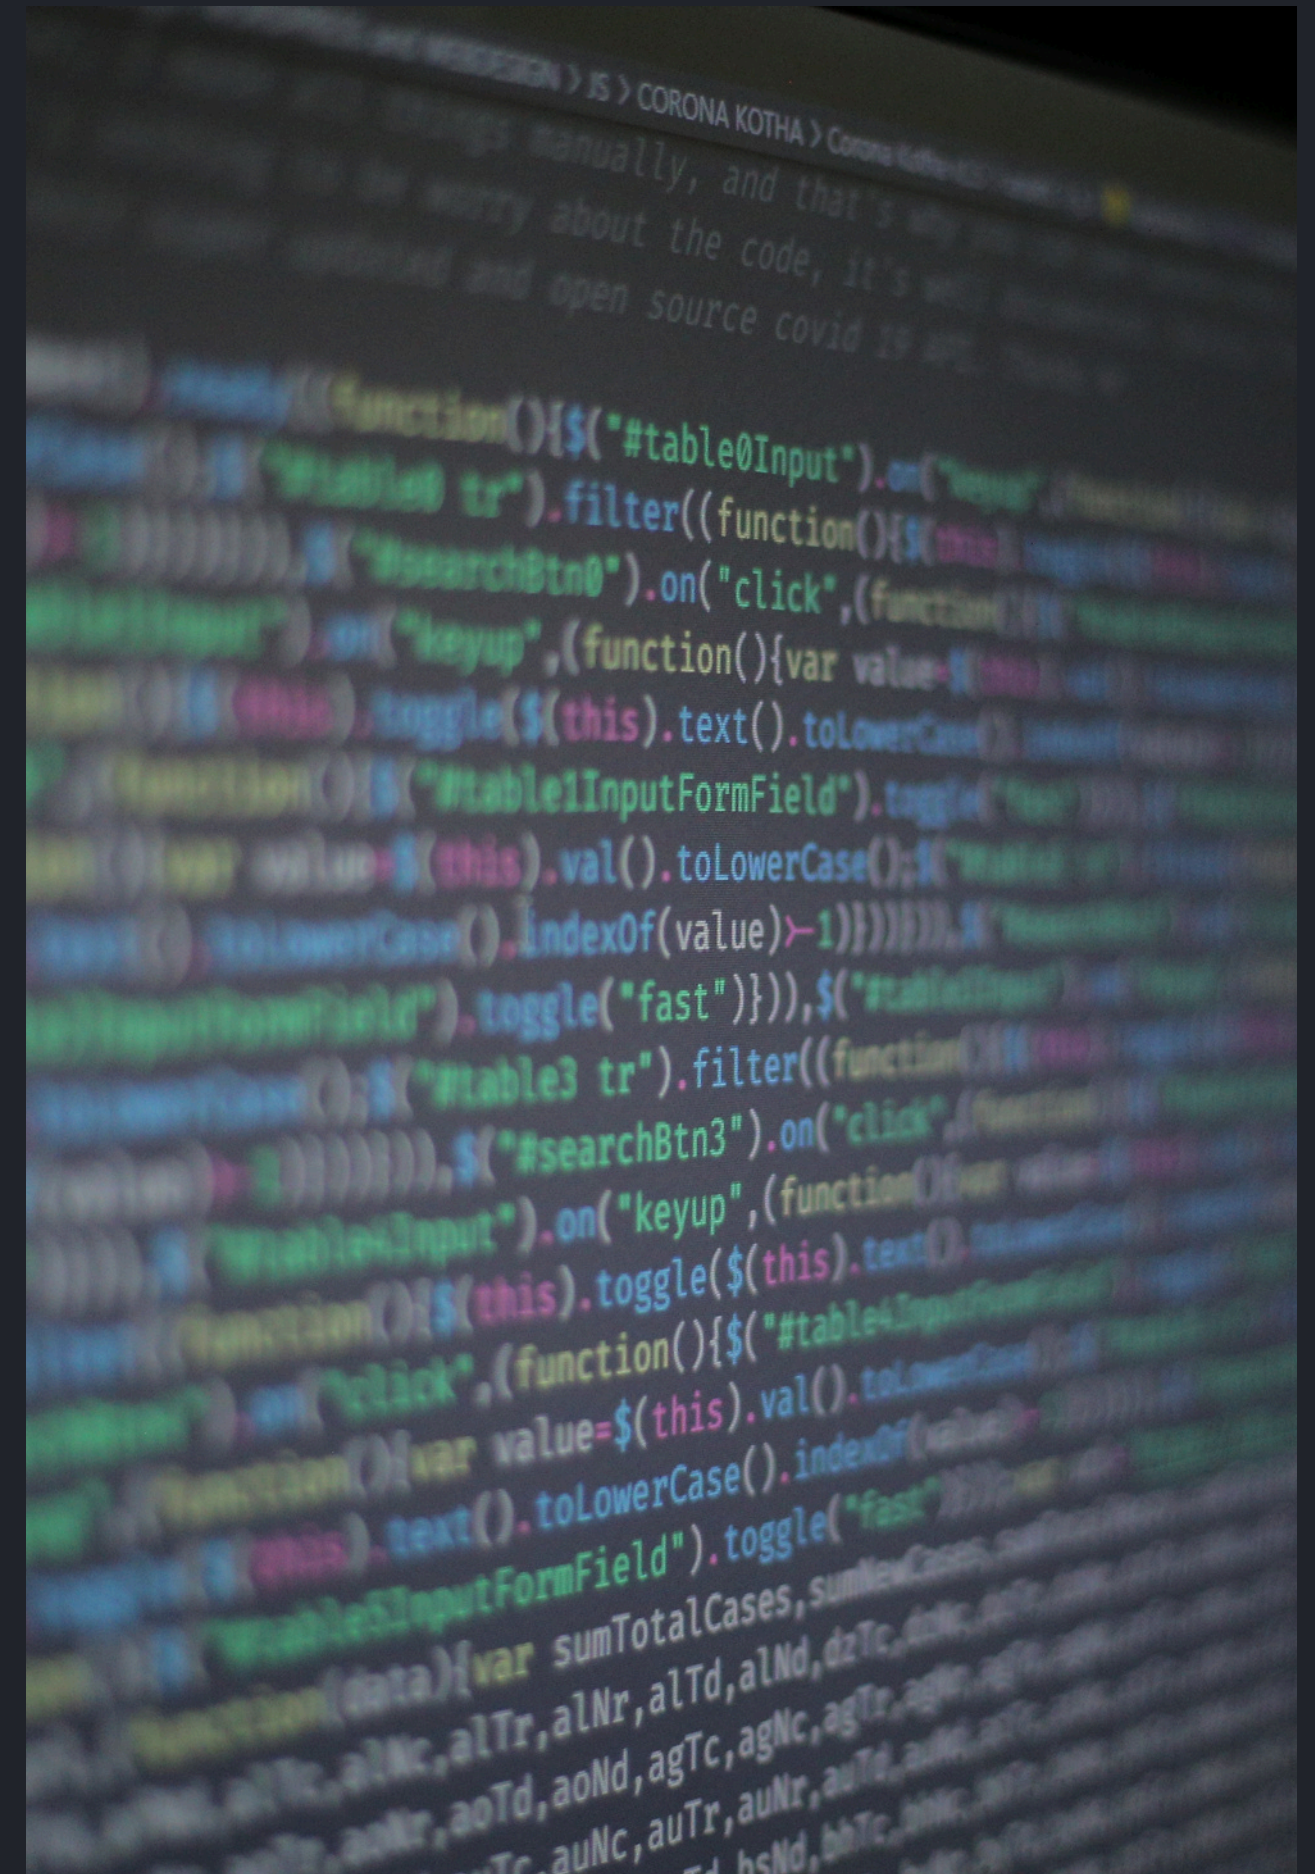

DistriCine digitizes the management of the university film club.

Facilitates viewing of listings, reservations, and schedules.

Developed in OOP, with classes, inheritance, and polymorphism.

Optimizes the cultural experience at the District University.

}

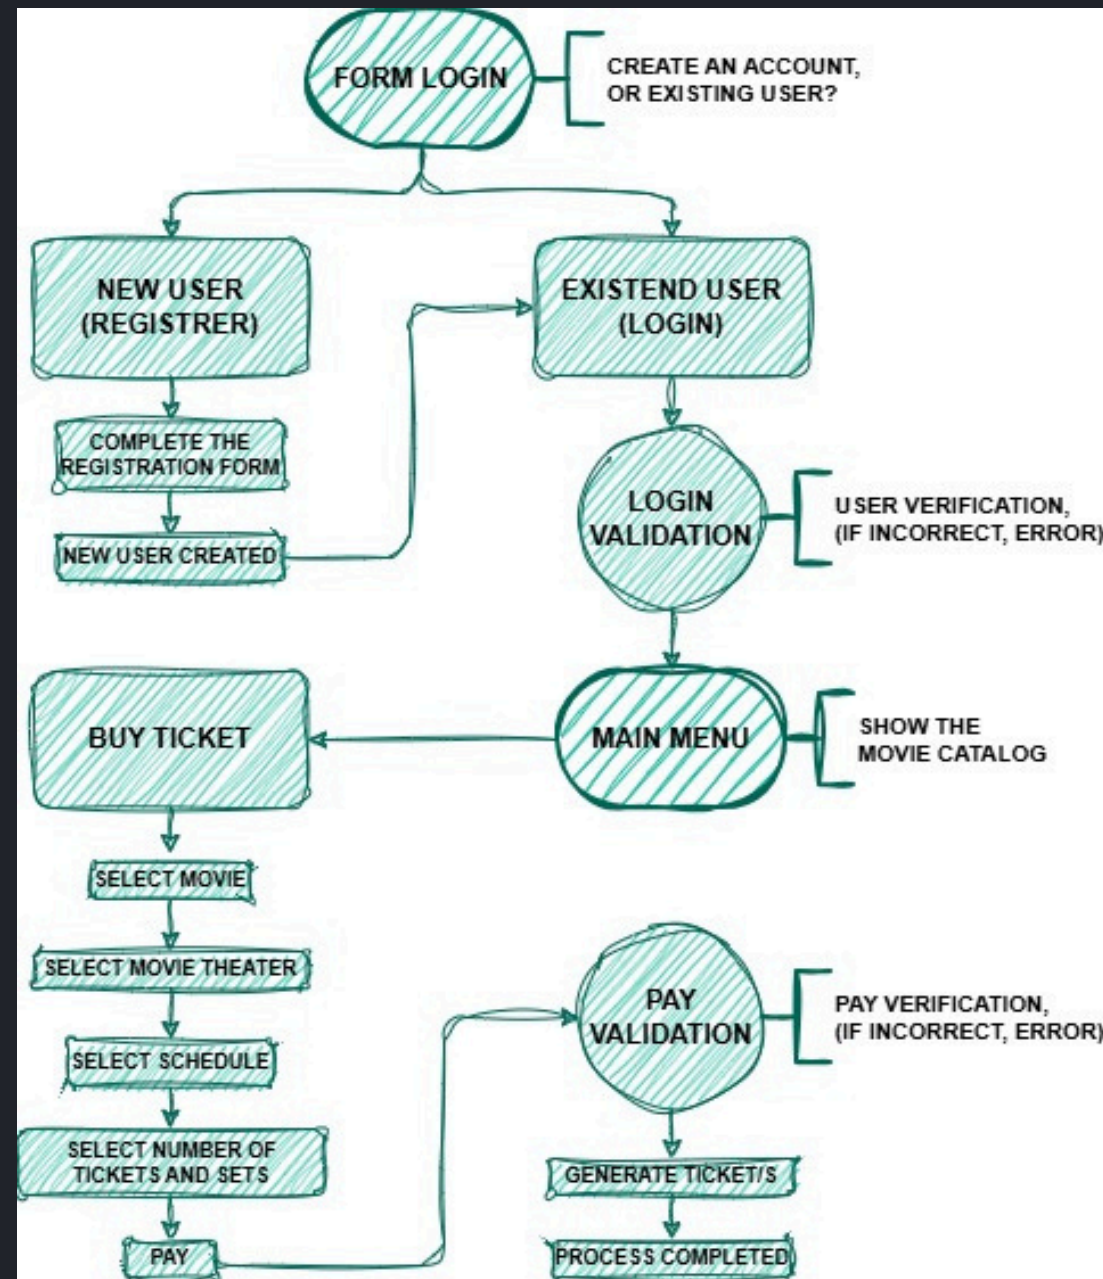

# Problem Statement {

The university currently manages film screenings through manual methods that are inefficient, decentralized, and not adapted to multiple campuses, resulting in low participation and poor resource management.

There is a need for a digital system that centralizes and automates this process in an academic context.

}

# Objectives {

## General:

Create a system to manage film club functions and reservations.

## Specific:

Apply OOP, use UML and CRC cards, Validate logic in the console, and prototype the interface in Figma.

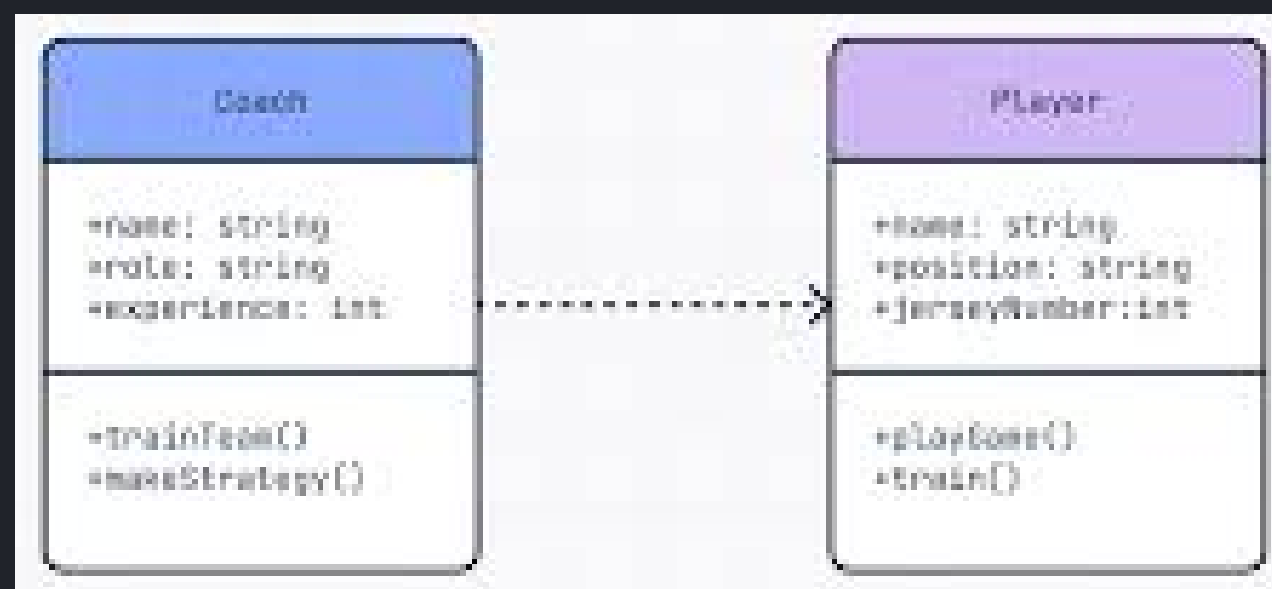

}

# Applied OPP Principles {

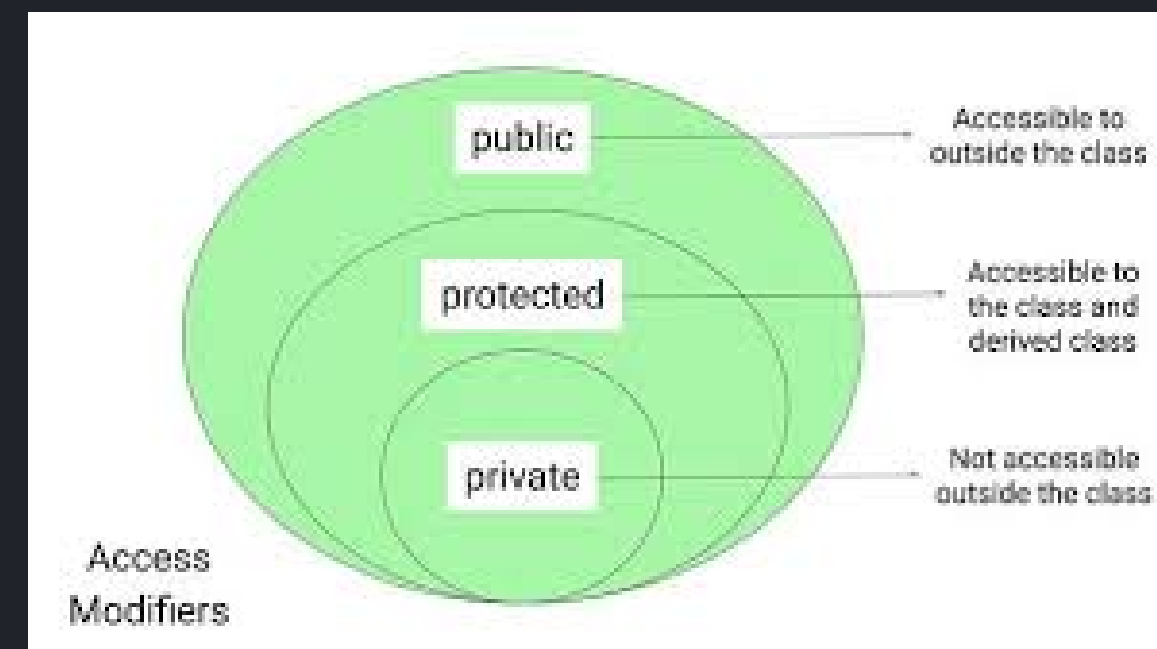

## CLASSES

Blueprint that defines the attributes and behaviors of objects within the system.

## ENCAPSULATION

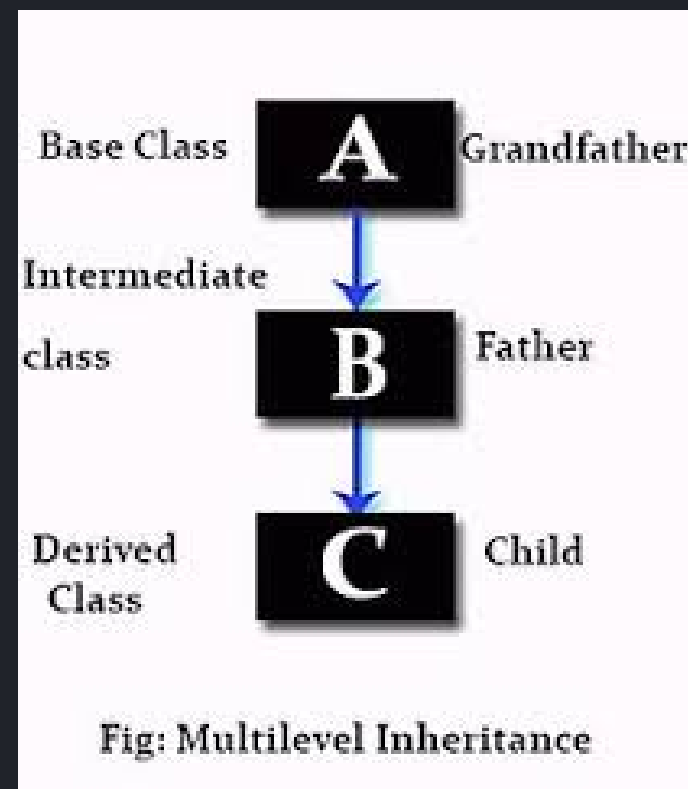

Protects data by controlling access through private attributes and public methods, ensuring integrity and security.

}

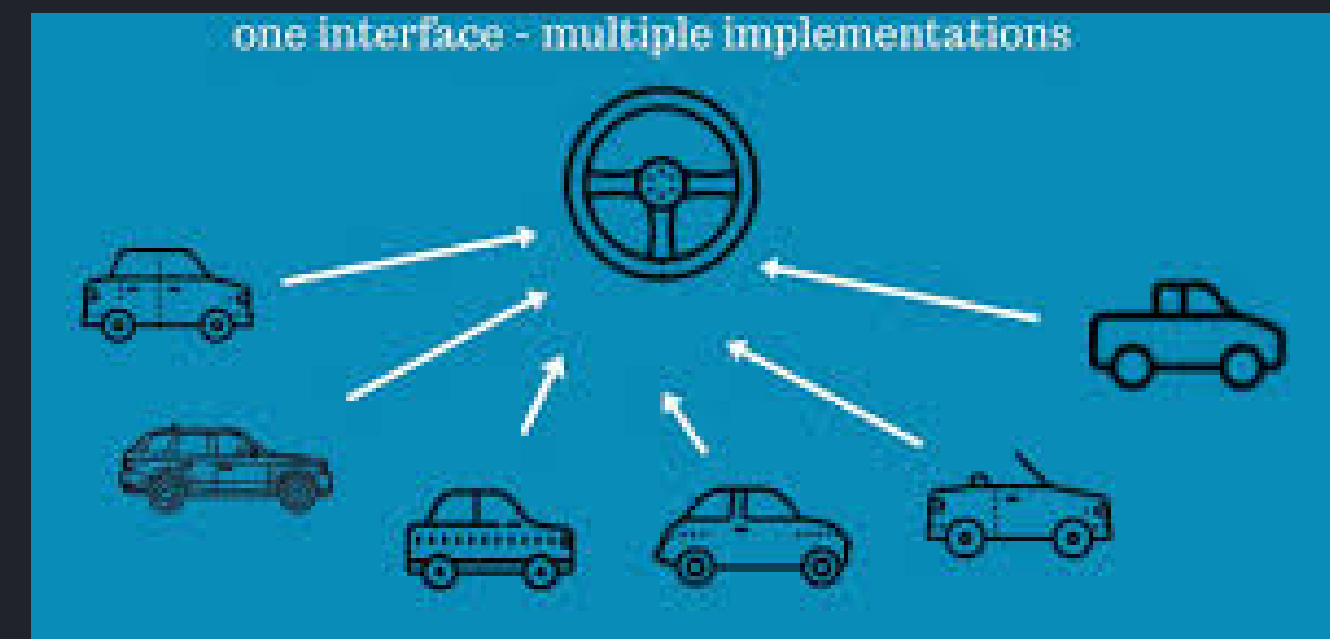

# INHERITANCE

Allows a class to acquire properties and behaviors from another, promoting reuse and hierarchy.

# POLYMORPHISM

Enables methods to behave differently based on the object that implements them, improving flexibility.

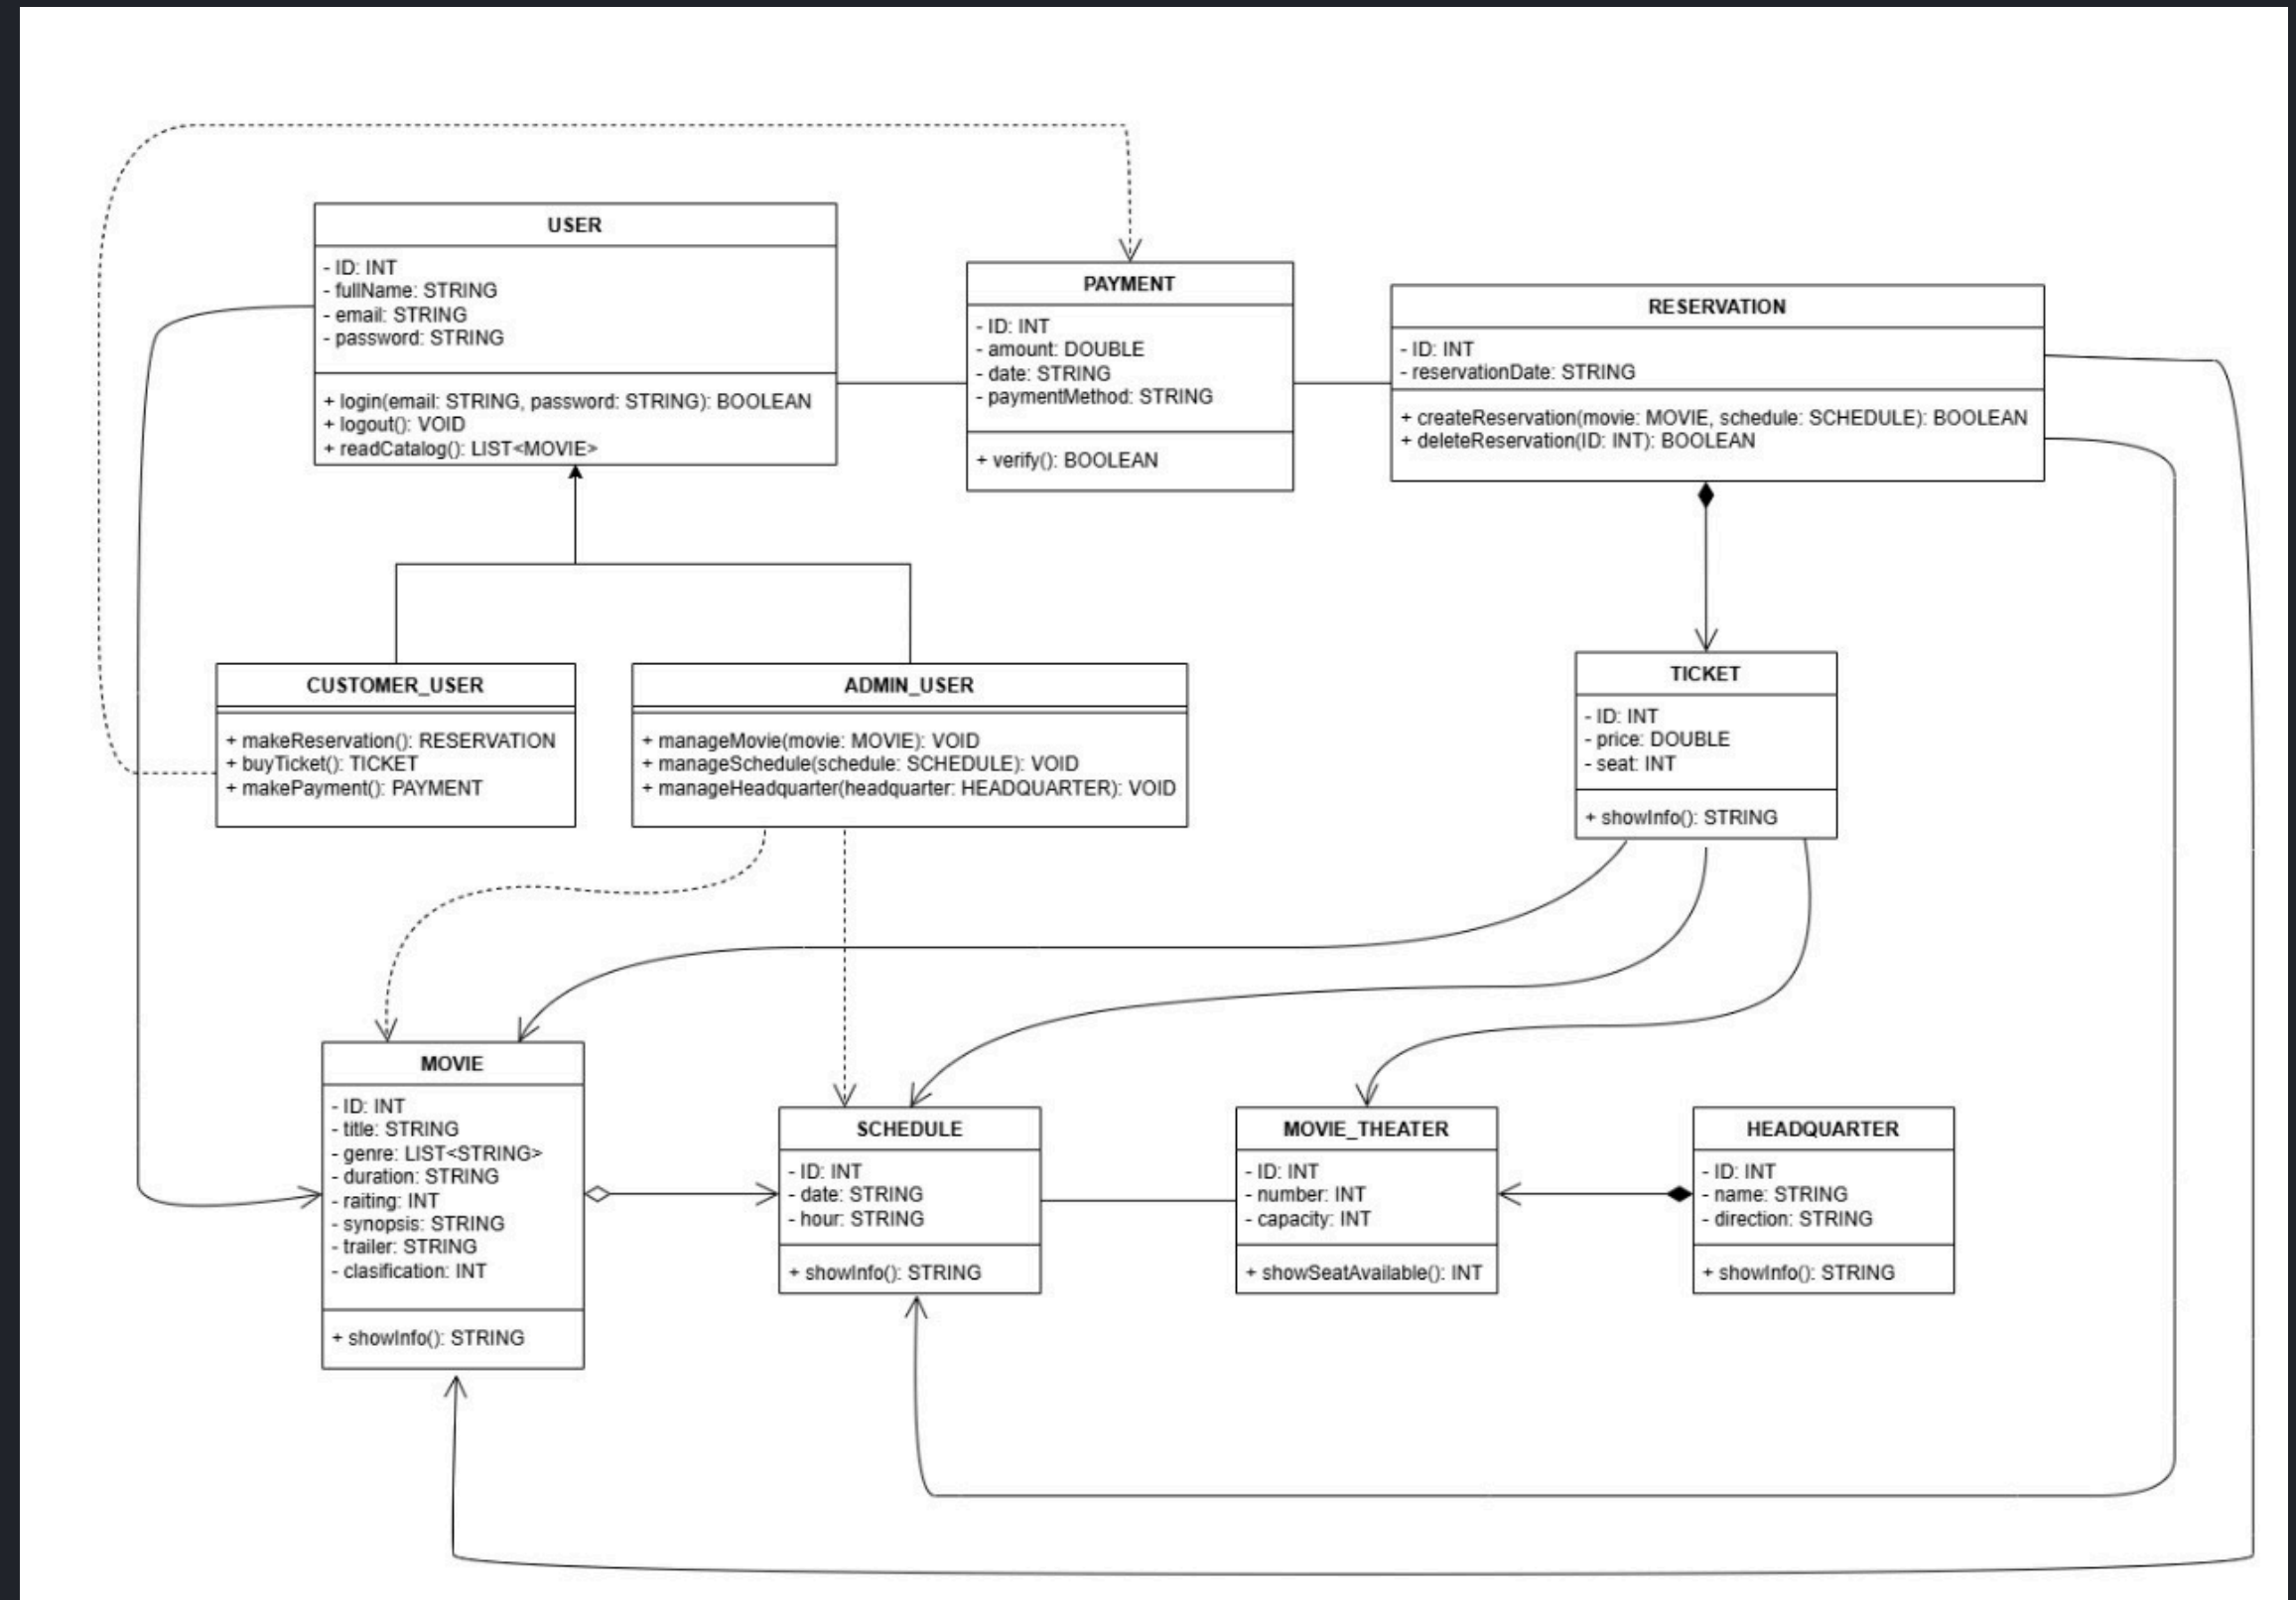

# Methodology {

## CLASS DIAGRAM:

- USER:  
(CUSTOMER – ADMIN)
- PAYMENT
- RESERVATION
- TICKET
- MOVIE
- SCHEDULE
- MOVIE\_THEATER
- HEADQUARTER

}

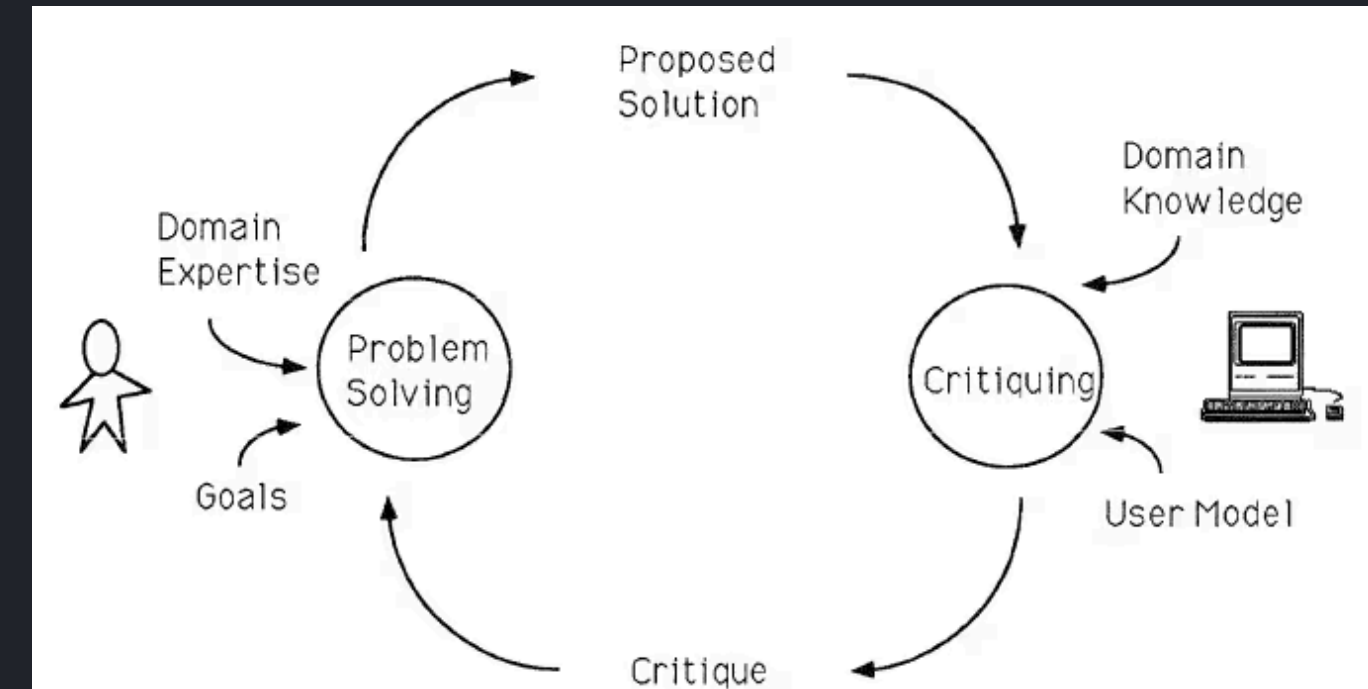

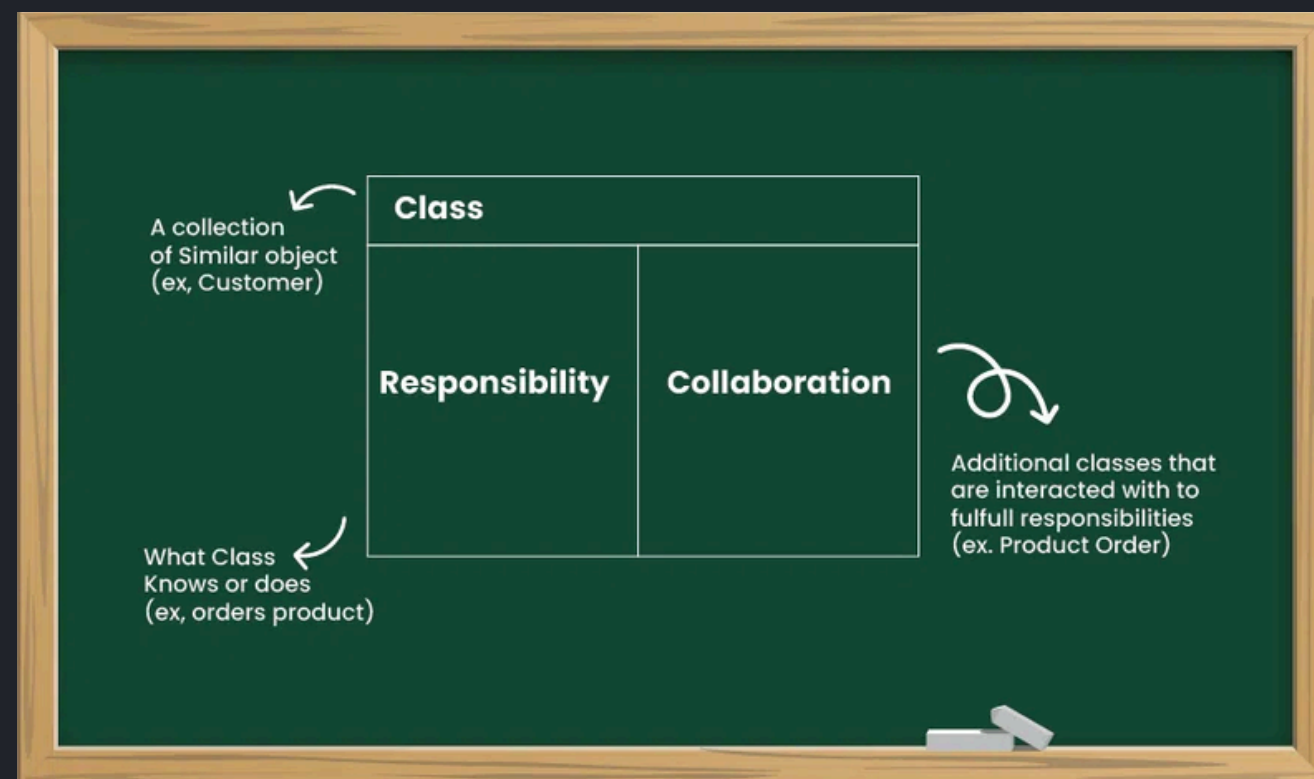

## CRC CARDS – USER CLASS:

Responsibilities: User data and menu.

Collaborators: AdminUser, CustomerUser.

## USER STORY:

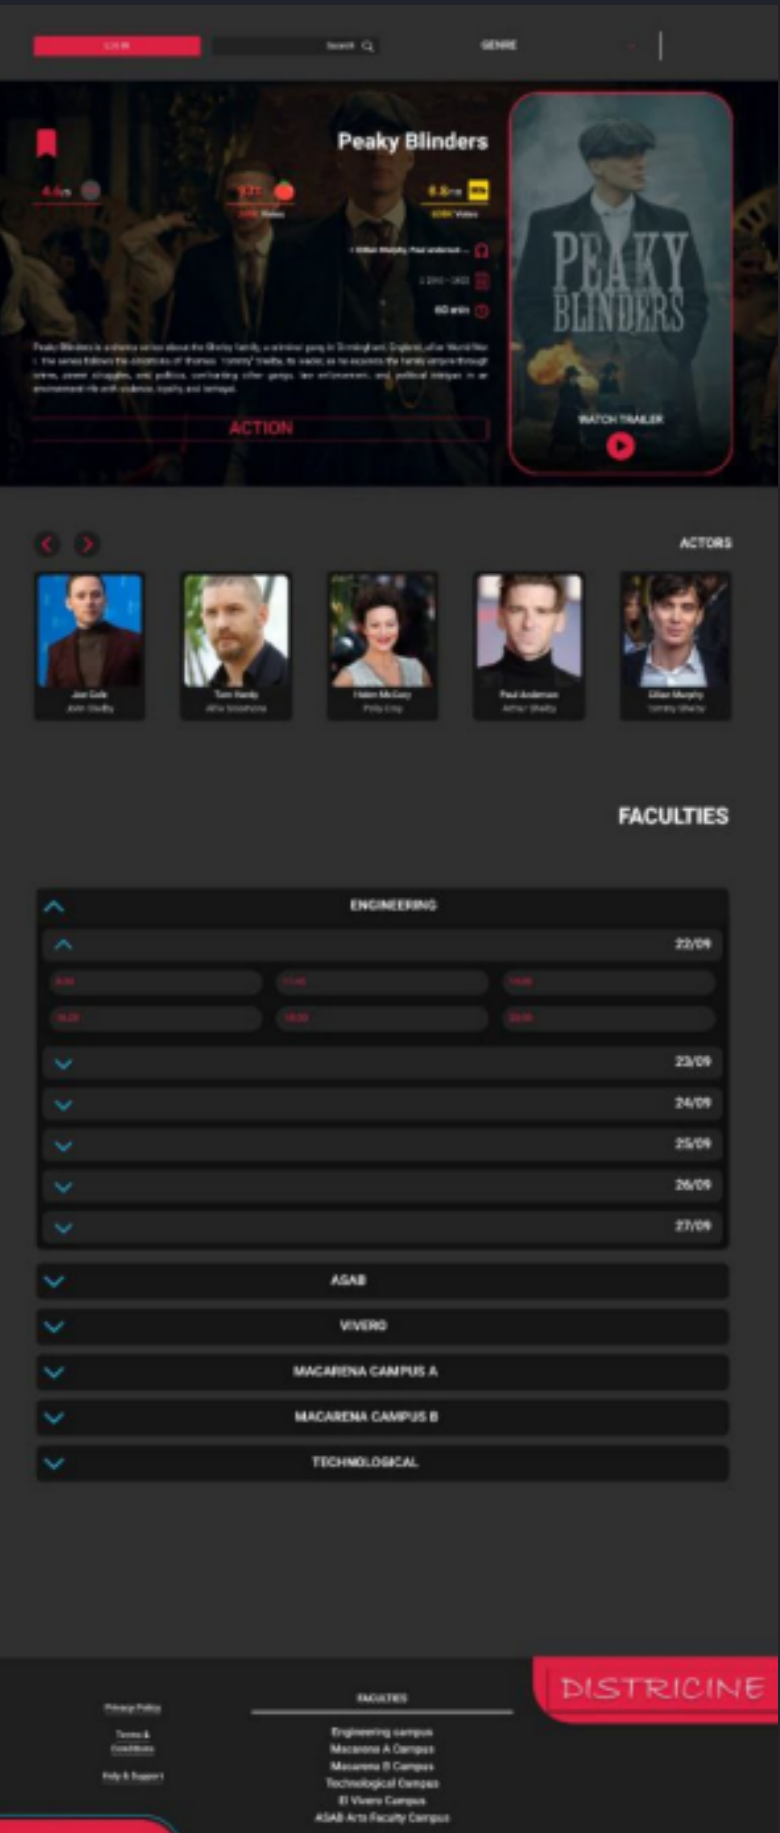

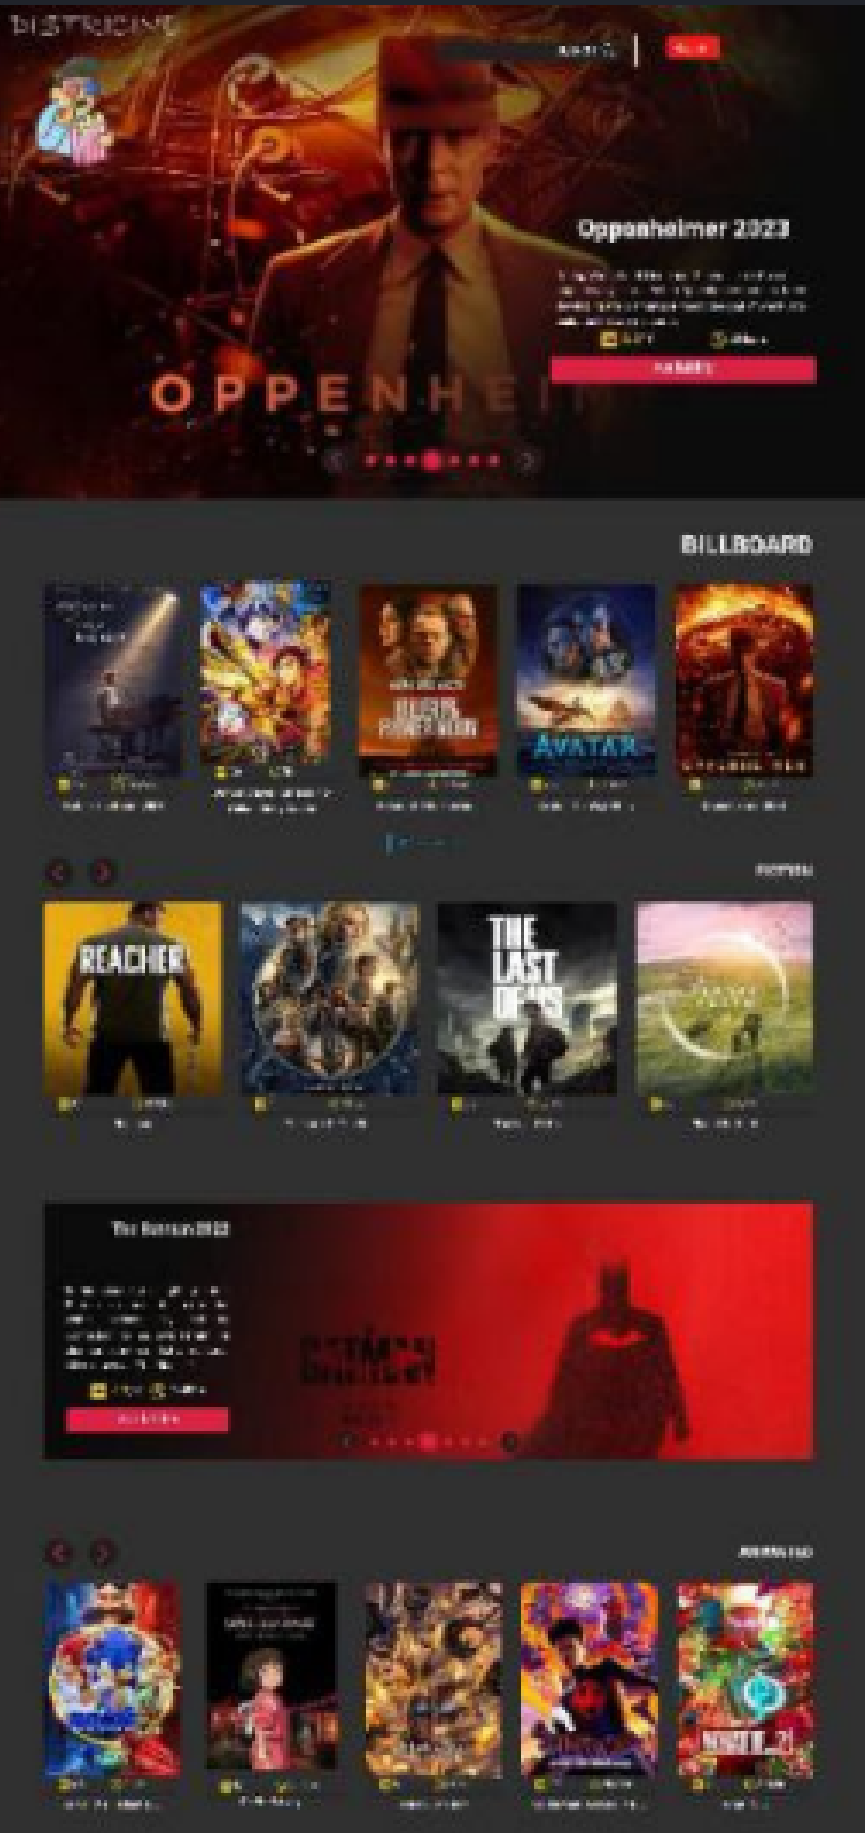

As a student, I want to be able to find out about movies so I can plan and attend the film club.

}

# MOCK-UPS:

The mockups developed for the DistriCine system visually represent the user interface before implementation.

The mockups visually represent the user interface and navigation flow of DistriCine, allowing early validation of usability and system functionality before implementation.

## Conclusions {

- Object-Oriented Design allowed a scalable and realistic system structure aligned with software engineering principles.
- The console prototype validated core functionalities, confirming system feasibility before adding interface and database layers.
- DistriCine is an innovative academic solution that applies OOP to real needs and sets the foundation for a future web application.
